

The Wave

The STEALTH Wave in its sonics relates to both the Reverie - because its conductive material is pure copper, but due to a different geometry of the Wave and very different internal structure (paralleled, individually jacketed conductor assemblies without a common overall jacketing – i.e. the same concept and similar appearance to the STEALTH most advanced digital cable, the Octava) – the Wave sound resembles the (copper-silver hybrid) Dream Petite to a greater degree than the Reverie, but still keeps the somewhat “darker” and more authoritative presentation of pure copper (compare to more “airy” presentation of the Dream).

Specifications

- White telfon dielectric with flexible STEALTH para-vacuum center multi-core
- The spacers have the same diameter as the wire assemblies, i.e. 6 mm (roughly 1/4 inch).
- Use of dividers to dramatically reduce the overall cable capacitance and thus assures stability (non-oscillation) of any amplifier.
- STEALTH Proprietary Solid Silver Spades or Silver Bananas
- Handmade in the USA
